evolutionary

An evolutionary perspective on regional port systems: the role of windows of opportunity in shaping seaport competition

Walter Boelch

 Received 19 November 2001, in final form 29 November 2002

Abstract How do seaports evolve in relation to each other? Recent studies in port economics and competition suggest that a key to a port's success is its ability to take advantage of opportunities that are available in the surrounding sea space in the world and national systems of port systems. However, there is still a lack of theoretical models that allow us to make a systematic analysis of regional (seaport) port systems. This article presents an evolutionary framework to explain the development of seaports in a regional context by drawing on the concept of windows of opportunity. The role of seaports in the process of regional development is also discussed.

1. Introduction

Over the last decade scholars of port economics and transport geography have been occupied with the strategic role of seaports within increasingly global integrated supply-chain systems (Harris, 1990; Adams and Hill, 2001; Whitehead and Whitlatch, 2001; Robinson, 2002; Slack, 1993; Slack et al., 2002). As a derived demand, maritime transport and the shipping sector evolved along an emerging global division of labour based upon the principles of 'the integration of trade and distribution of production in the world economy' (Harris, 1990). The maritime transport sector, in particular, through its mass application of the container since the late 1970s, has indeed been a key feature of the process of global economic integration (Lorenson, 2000). At the same time, processes of integration and market consolidation in the shipping industry have been accompanied by a process of competition, location and agglomeration in these phase within port systems development (Stenback and Rodriguez, 2005). What is less understood, however, is how the geographical location of seaports and other port-related facilities, such as the role of agency and of institutions in within the evolutionary process. In this paper we aim at understanding the evolution of regional port systems by making use of conceptual insights from both institutional and evolutionary approaches within economic geography. As such, we expand on earlier work on the evolution of the institutional and structural connections between transport and economic geography (Hill et al., 2000). In particular, we draw upon the conceptual model of Hill et al. (2000), in which the evolution of port systems and their institutional connections through different evolution stages, of opportunity open and close in certain locations through different evolution stages, leading to another process of institutional evolution. By adding a relational dimension to the perspective of Robinson et al., we apply it to the specific case of a seaport

That is, there is a species-typical design with variation among individuals coming from many sources, both genetic and environmental. In this way, theories of function can guide hypotheses regarding environmental influences on development. Although evolutionary approaches are often equated with strong versions of nativism, these characterizations do not capture the theoretical commitments of the approach. & Wilson, M. To do this, it takes input in the form of electromagnetic radiation, and transforms it through many different steps, which include things like eAAÁedge detectorscAAÁ and other specialized computational devices. Further, for any given computational problem to be solved, the broader the range of problems a mechanism is designed to solve, the worse it will be at solving them, and, the more narrow the range of problems a computational mechanism is designed to solve, the better it will be at solving them. Any functional aspect of the phenotype must necessarily have concomitant byproducts, features that are incidental consequences that were not selected by virtue of a functional role. NY: Oxford University Press. Chomsky developed an argument he referred to as the eAAÁpoverty of the stimulus,cAAÁ that natural language cannot be learned with only the information that the language learner (the child) receives as input. Darwin, C. That is, natural selection will retain genes that cause interactions with the environment that lead to the reliable construction of the functional mechanisms that solve adaptive problems. Sex differences in human mate preferences: Evolutionary hypotheses tested in 37 cultures. M. One of the most thoroughly described phenomena in psychology to be described is vision. The eye is a complex organ that has evolved to see light and to process it in a way that allows us to see the world around us. The same basic principles of the organization of trade and distribution of production in the world economy' (Harris, 1990). The maritime transport sector, in particular, through its mass application of the container since the late 1970s, has indeed been a key feature of the process of global economic integration (Lorenson, 2000). At the same time, processes of integration and market consolidation in the shipping industry have been accompanied by a process of competition, location and agglomeration in these phase within port systems development (Stenback and Rodriguez, 2005). What is less understood, however, is how the geographical location of seaports and other port-related facilities, such as the role of agency and of institutions in within the evolutionary process. In this paper we aim at understanding the evolution of regional port systems by making use of conceptual insights from both institutional and evolutionary approaches within economic geography. As such, we expand on earlier work on the evolution of the institutional and structural connections between transport and economic geography (Hill et al., 2000). In particular, we draw upon the conceptual model of Hill et al. (2000), in which the evolution of port systems and their institutional connections through different evolution stages, of opportunity open and close in certain locations through different evolution stages, leading to another process of institutional evolution. By adding a relational dimension to the perspective of Robinson et al., we apply it to the specific case of a seaport
